

ABSTRACT OF THE DISCLOSURE

In an on-board display apparatus, a transmission type display device is provided on a forward and displays a touch switch display when necessary, and the operability as a touch panel is ensured. The transmission type display device can be turned to be transparent, and an image display device is provided on a backward of the transparent portion. Since the display screen of the image display device is backward, the visual range is long, and the visibility can be improved. Since the display screen of the image display device and the display screen of the transmission type display device are not on the same plane, even if the touch switch display is touched by a finger, an image can be seen, and a pointer can be displayed on the display screen of the image display device in a position corresponding to the touched position, and thus the operability can be improved.
